NOTES Patient Notes

BJ: 08-12-24 : Post MDAEH transfer/visit for Arthas. The ER doctor informed us that O opted to euthanize given Arthas's prognosis, she also stated that there was concern about ever having P neutered because of his airways. Also that Arthas would OR had to be carried up and down the stairs because he couldn't. ER doctor did say we did a good job with everything we could in regards to his condition given his anatomy and how brachycephalic dogs can be.

BJ: 08-12-24 : Arthas was dropped off for boarding this morning around 9am. At drop off Arthas seemed anxious but overall healthy. I did pick him up and carry him back to the kennel as he did not

Date	By	Code	Description	Qty (Variance)
want really come back and kept walking behind/around mom's legs. We placed Arthas in the kennel with no issues, he did begin to bark a bit after being in the kennel (a lot of our other boarders were barking too). Colette noted that the barking was increasing and went in the kennel room to check on everyone and at that time she noticed Arthas was breathing heavy and it sounded like a guinea pig squeak at that time she called up to me from the hallway to come and check him as well (this was at 9:50a directly after checking in a patient). We brought Arthas out of his kennel to check him over and notice a slight bit of soft stools (likely stress diarrhea) as well as an increase in respiratory effort (hyperventilating) and that his tongue was a little cyanotic. We immediately brought him back to EP informing her of the situation and started him on oxygen, Arthas was very stressed and did not like the oxygen mask on his face so we proceeded with flow by oxygen. Arthas would occasionally retch/gag like he was going to vomit but did not produce anything. EP did a brief exam and it was suspected that Arthas had aspiration pneumonia due to stress/hyperventilating. Ivy made 4 attempts (total between all the numbers) to call the owner and left a message on another number, other VM-box was full (it would ring, get to the VM and then just cut off). I also called the owner and she answered, I ask who do I have the pleasure of speaking with and she said [REDACTED] said OK and let her know that Arthas was very stressed and in severe respiratory distress. O [REDACTED] said ok, that they had already left and asked what we wanted her to do. O also asked if we left him outside in which I responded with No, he has been in his kennel since drop off to decompress. I asked O to contact her emergency contact for while they are away and she said she would call her [REDACTED] and then call us back. I did not inform O that P was blue/purple (cyanotic) as I did not want to cause additional panic as well as "give a diagnosis". We continued supportive care and oxygen while waiting for O's [REDACTED] to arrive. Once [REDACTED] got to the office we informed her of the situation as well as how serious things were and that he would need to be transferred to MDAEH. EP called over for instruction on how to proceed with Arthas from there [REDACTED] went to MDAEH to obtain a portable oxygen tank for transport of Arthas while we placed a 20g IV cath into his front right cephalic vein. MDAEH also instructed us to use propofol to sedate, intubate and radiograph Arthas. We did all of this and forwarded the rads to MDAEH. P stayed on oxygen with the tube in place till transfer. I went along in the car for the transfer, while in the car Arthas began retching/gagging again with production of vomit risking aspiration pneumonia a 2nd time. I immediately de-puffed the cuff on his tube and removed it while on transport. I used my hand and a washcloth to clear his mouth/throat of the mucous/food filled vomit as best as possible. EP: 08-12-24 : Arthas was dropped off for boarding at 9 am. At 9:45-10 am we heard severe respiratory distress. We started Arthas on oxygen. He did not like the mask, so we have been giving him floc-by oxygen. His lungs sound very fluidly. We gave him 50 mg of Furosemide IM and 3 mg of Dexamethasone SP IM. A catheter was placed . An injection of 3.5 mg of Torbugesic was given IV. Arthas was given Propofol iv to sedate him enough to intubate him. An injection of 25 mg Diphenhydramine was given IV. Chest xrays were obtained, a lateral and DV. which have been forwarded to MDAEH. Owner's [REDACTED] went to pick up a portable oxygen cage. Arthas was transported to MDAEH with Britt monitoring Arthas.

EP: 08-19-24 at 3:46p: called 2 numbers and LM O called back. I explained what happened with Arthas. I told her that 50 minutes after dropping him off, we heard a lot of dogs barking and checked on the dogs. Arthas was in respiratory distress and				

Date	By	Code	Description	Qty (Variance)
			squeaking like a guinea pig. We immediately tried calling the owner. She reached her [REDACTED] who came to pick him up. She said she was not told the severity of his condition and that her [REDACTED] was taking him home. I told her we put him into a kennel inside when he arrived. We immediately started him on oxygen. Unfortunately the mask made him stress more, so we used flow by oxygen. We inserted an IV catheter so we could sedate him briefly to be able to pass an endotracheal tube so the oxygen would go straight to his lungs. His lungs were fluid filled like he had aspirated fluid. He was give a dose of Lasix to try and help with the fluid and his breathing. I told her we tried calling numbers five times. She said she only had 2 messages on her phone and she also wasn't told how serious his condition was. She said she was told her [REDACTED] was to come and take him home. I told her that the short nosed dog breeds have a lot of problems with their respiratory tract. She said she came in on Saturday, but we were closed. I explained to her that I was at a veterinary meeting for the weekend. She wants to have all of his records.
